

**Hand: Paradigm 1 vs Paradigm 2 — the robust Paradigm 1 step is stationary → moving; between moving speeds neither paradigm shows a reliable change**  
(shaded band = speeds shared by both paradigms; thin lines = participants; bands = 95% bootstrap CI of the group mean)

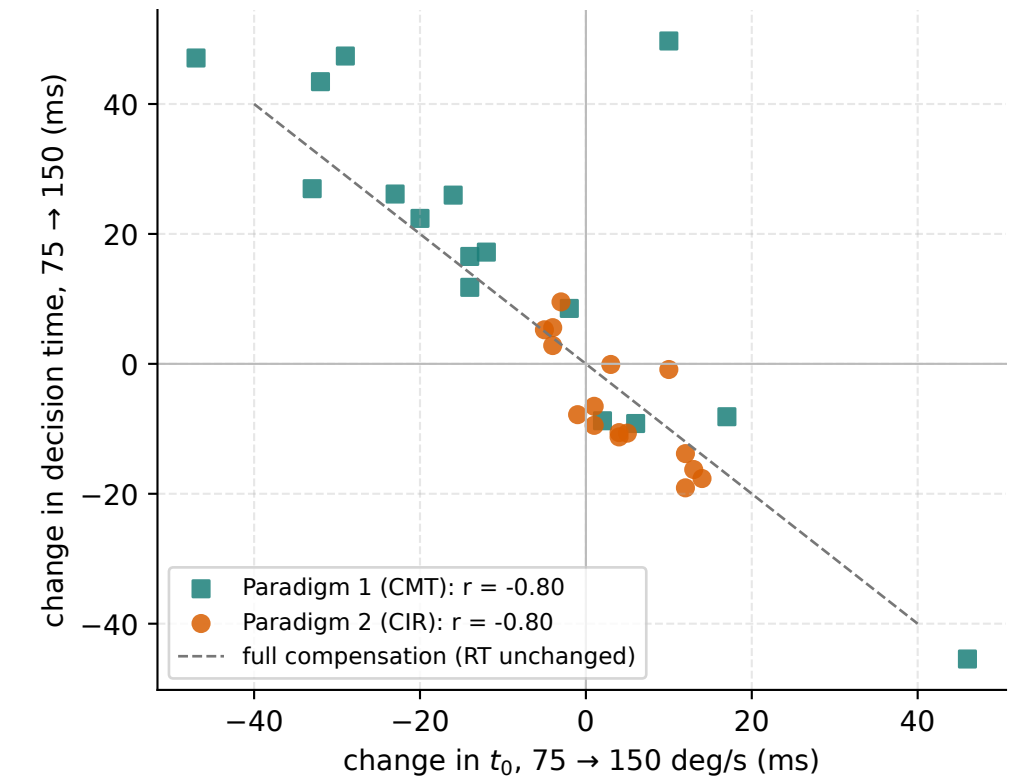

**A. Hand non-decision time  $t_0$  (Method B)**

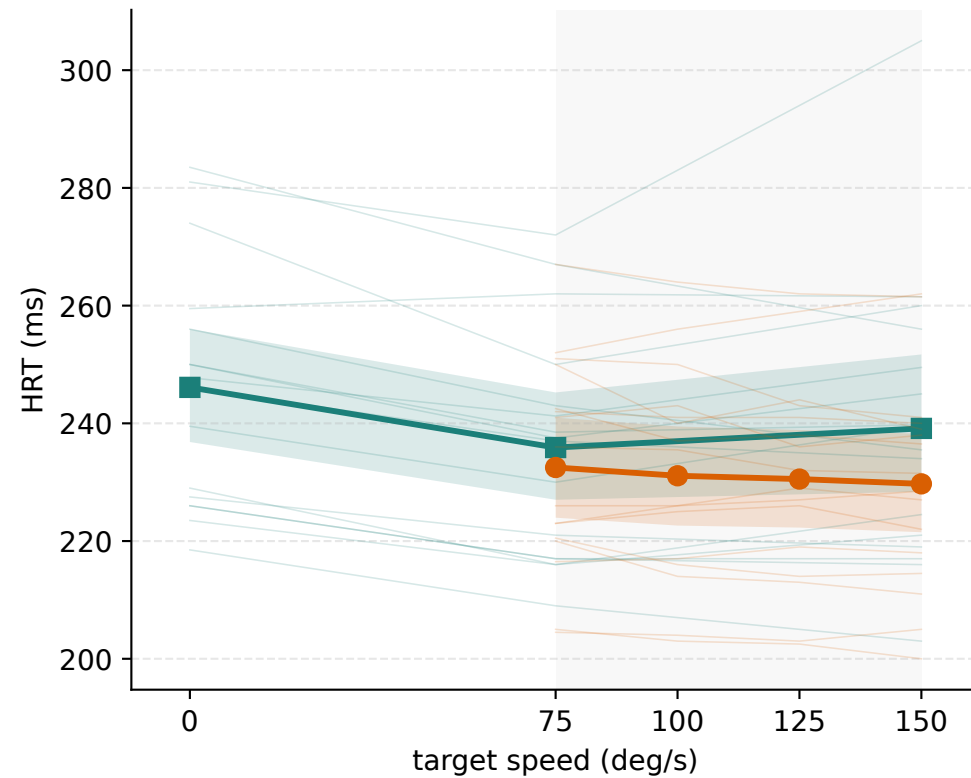

**B. Hand decision time  $a/v$  (Method B)**

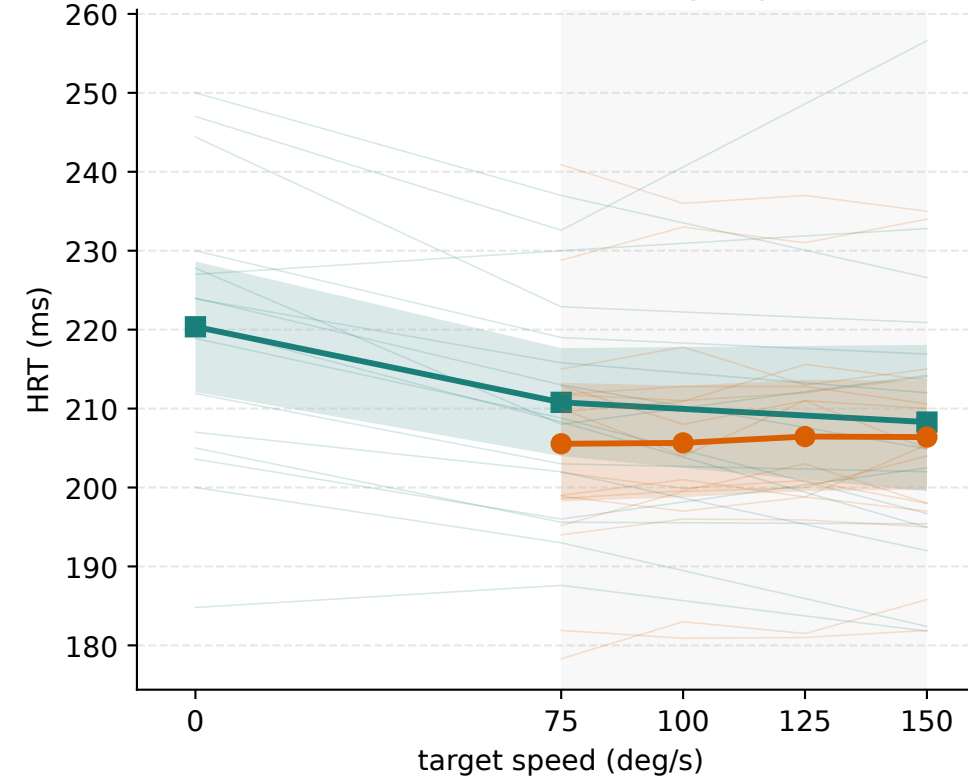

**C.  $t_0$  and decision-time changes cancel each other**  
(one point per participant;  $r \approx -0.75$  arises from estimation noise alone)

**D. Raw median HRT (model-free)**

**E. Raw 10th-percentile HRT (leading edge, model-free)**

**F. Which steps are real? (Wilcoxon signed-rank p)**
