

Non-Decision Time (t_0) — Hierarchical Bayesian estimates

HRT: hand non-decision time is identifiable and decreases with target speed (170→158→148 ms; 0/48 cells floored). SRT: saccadic non-decision time is NOT identifiable — with the 70 ms physiological floor enforced, every participant pins at the floor (the data favour even lower values), so it is reported as fixed at 70 ms rather than estimated per participant.
