

# Saccadic RT with fixed non-decision time (Paradigm 1) — sensitivity of drift and fit quality to the assumed $t_0$

**A. Mean drift by speed under each fixed  $t_0$**   
(speed-profile correlation across  $t_0$  values: min  $r = 0.96$ )

**B. Mean KS under each fixed  $t_0$**   
(range across  $t_0$  values: 0.002)
